Safety Guidelines

General Guideline

CAUTION

- Do not place any heavy object on the ASR-6000.
- Avoid severe impact or rough handling that leads to damaging the ASR-6000.
- Do not discharge static electricity to the ASR-6000.
- Use only mating connectors, not bare wires, for the terminals.
- Do not block the cooling fan opening.
- Do not disassemble the ASR-6000 unless you are qualified.
- If the equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.
- Due to the fact that ASR-6000 unit weights greater than 18kg, please resort to the standard kit GRA-451-E for transport or remove the unit by at least two persons in case of danger occurred.

Interface Configuration

Ethernet Remote Interface

The Ethernet interface can be configured for a number of different applications. Ethernet can be configured for basic remote control or monitoring using a web server or it can be configured as a socket server.

The ASR-6000 supports both DHCP connections so the instrument can be automatically connected to an existing network or alternatively, network settings can be manually configured.

However, if the DHCP is not present, it will automatically assign an IP address between 169.254.1.0 and 169.254.254.255 using the AUTO-IP configuration when the instrument set on DHCP.

Using Realterm to Establish a Remote Connection

Background

Realterm is a terminal program that can be used to communicate with a device attached to the serial port of a PC or via an emulated serial port via USB.

The following instructions apply to version 2.0.0.70. Even though Realterm is used as an example to establish a remote connection, any terminal program can be used that has similar functionality.

Note

Realterm can be downloaded on Sourceforge.net free of charge.

For more information please see
<http://realterm.sourceforge.net/>

Operation

1. Download Realterm and install according to the instructions on the Realterm website.
2. Connect the ASR-6000 via USB (page 24) or via RS-232 (page 26).
3. If using RS-232, make note of the configured baud rate, stop bits and parity.
4. Go to the Windows device manager and find the COM port number for the connection. For example, go to the Start menu > Control Panel > Device Manager.

Double click the *Ports* icon to reveal the connected serial port devices and the COM port for the each connected device.

If using USB, the baud rate, stop bit and parity settings can be viewed by right-clicking the connected device and selecting the *Properties* option.

5. Start Realterm on the PC as an administrator.
Click:
Start menu>All Programs>RealTerm>realterm

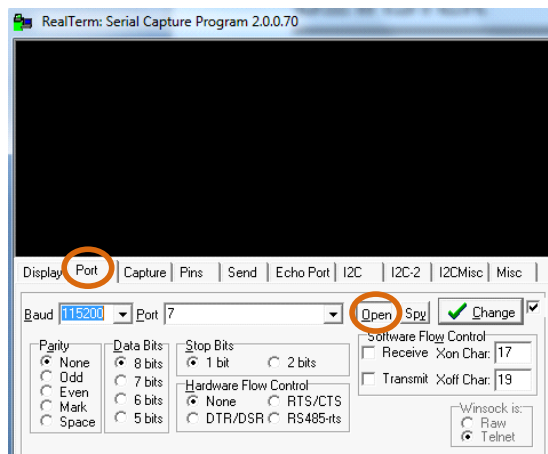

Tip: to run as an administrator, you can right click the Realterm icon in the Windows Start menu and select the *Run as Administrator* option.

6. After Realterm has started, click on the *Port* tab.

Enter the *Baud*, *Parity*, *Data bits*, *Stop bits* and *Port number* configuration for the connection.

The *Hardware Flow Control*, *Software Flow Control* options can be left at the default settings.

Press *Open* to connect to the ASR-6000.

Note

For USB, the baud rate should be fixed to 115,200.

7. Click on the *Send* tab.

In the *EOL* configuration, check on the *+LF* check boxes.

Enter the query:

*idn?

Click on *Send ASCII*.

8. The terminal display will return the following:

GW-INSTEK, ASR-6XXX, GXXXXXXXXX, XX.XX
(manufacturer, model, serial number, software version)

9. If Realterm fails to connect to the ASR-6000, please check all the cables and settings and try again.

Optional Remote Interface

There are up to 3 optional remote interfaces available (GPIB, CAN BUS, DeviceNet) and we simply engage in GPIB here due to SCPI-format programming document. For information related to other remote interfaces like CAN BUS & DeviceNet, please refer to CAN BUS and DeviceNet programming manual, respectively.

GPIB Configuration

1. Connect a GPIB cable from the PC to the GPIB port on the rear panel.

2. Press the *Menu* key. The Menu setting will appear on the display.

3. Use the scroll wheel to go to item 6, *Option Interface* and press *Enter*.
4. Set the GPIB address.

GPIB Address	0 ~ 30 (10 by default)
--------------	------------------------

GPIB Configuration

Note

- Only one GPIB address can be used at a time.
- ASR-6000 series can detect optional interface card automatically and the corresponding option interface page will be displayed accordingly.

Exit

5. Press *Exit*[F8] to exit from the GPIB settings.

GPIB Constraints

- Maximum 15 devices altogether, 20m cable length, 2m between each device
- Unique address assigned to each device
- At least 2/3 of the devices turned On
- No loop or parallel connection

Note

The standard accessory does Not include GPIB data cable. Please purchase the additional GTL-248 which will meet your need for GPIB connection.

GPIB Function Check

Functionality
Check

Please use the National Instruments Measurement & Automation Controller software to confirm GPIB/LAN functionality.

See the National Instrument website,
<http://www.ni.com> for details.

Note

- For further details, please see the programming manual, available on the GW Instek web site @ www.gwinstek.com
- Operating System: Windows XP, 7, 8, 10

Operation

1. Start the NI Measurement and Automation Explorer (MAX) program. Using Windows, press:

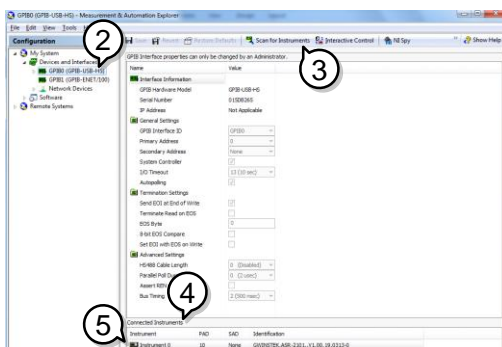

Start>All Programs>NI MAX

2. From the Configuration panel access;
My System>Devices and Interfaces>GPIB0

3. Press the *Scan for Instruments* button.
4. In the *Connected Instruments* panel the ASR-6000 should be detected as *Instrument 0* with the address the same as that configured on the ASR-6000.
5. Double click the *Instrument 0* icon.

6. Click on *Communicate with Instrument*.
7. Under the Communicator tab, ensure **IDN?* is written in the *Send String* text box.

9. The instrument identification string will be returned to the buffer area:

GW-INSTEK, ASR-6XXX, GXXXXXXXXX, XX.XX
(manufacturer, model, serial number, software version)

10. The function check is complete.

Web Server Remote Control Function Check

Functionality Check

Enter the IP address of the power supply (for example: `http://XXX.XXX.XXX.XXX`) in a web browser after the instrument has been configured for LAN (page 23).

The web interface allows you to:

- View the system and information and the network configuration.
- Monitor of measurements and/or full control of the power supplies. If the operator is not near the actual instruments being controlled, particular care must be taken to the appropriate access control limits.

Example:

Socket Server Function Check

Background	To test the socket server functionality, National Instruments Measurement and Automation Explorer can be used. This program is available on the NI website, www.ni.com , via a search for the VISA Run-time Engine page, or “downloads” at the following URL, http://www.ni.com/visa/
------------	---

Requirements	Operating System: Windows XP, 7, 8, 10
--------------	--

Functionality Check	1. Start the NI Measurement and Automation Explorer (MAX) program. Using Windows, press:
---------------------	--

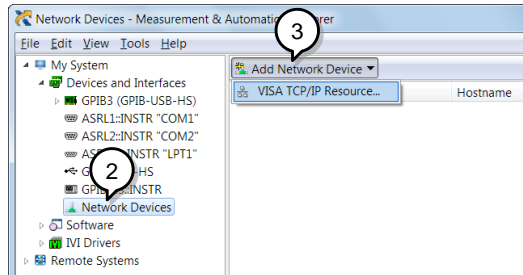

Start>All Programs>NI MAX

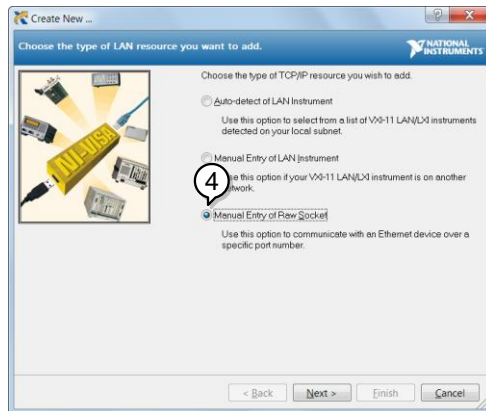

2. From the Configuration panel access;

My System>Devices and Interfaces>Network Devices

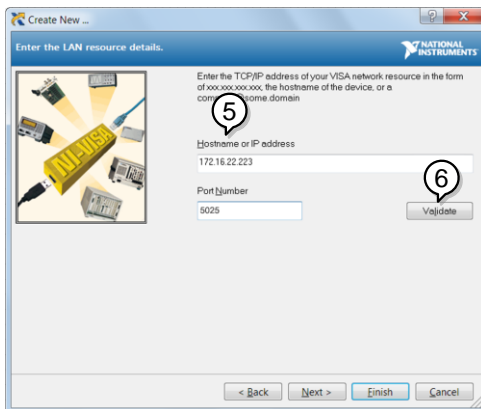

3. Press *Add New Network Device>Visa TCP/IP Resource...*

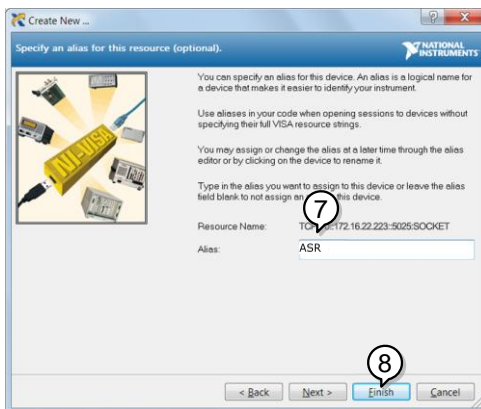

4. Select *Manual Entry of Raw Socket* from the popup window.

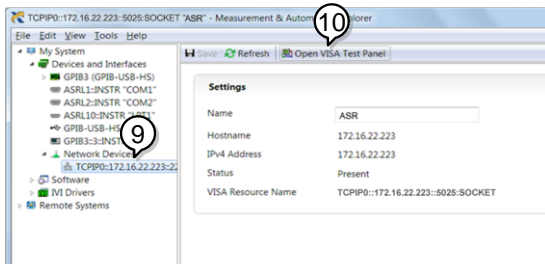

5. Enter the IP address and the port number of the ASR-6000. The port number is fixed at 5025.
6. Double click the Validate button and press *Next*.

7. Next configure the Alias (name) of the ASR-6000 connection. In this example the Alias is: ASR
8. Click finish.

9. The IP address of the power supply will now appear under Network Devices in the configuration panel. Select this icon now.
10. Press *Open VISA Test Panel*.

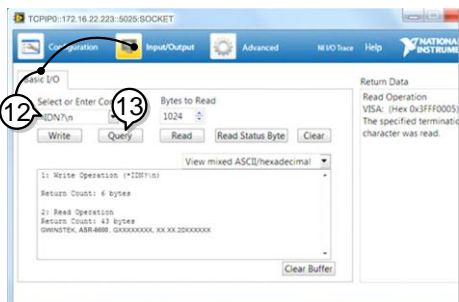

11. Click the *Configuration* Icon. Under the *IO* Settings tab check *Enable Termination Character*. The termination character should be set as *Line Feed - \n*.

12. Click the *Input/Output* icon. Under the *Basic I/O* tab, make sure **IDN?\n* is entered in the *Select or Enter Command* drop box.
13. Click *Query*.

The ASR-6000 will return the machine identification string into the buffer area:

GW-INSTEK, ASR-6XXX, GXXXXXXXXX, XX.XX

Note

For further details, please see the programming manual, available on the GW Instek web site @ www.gwinstek.com.

Command Syntax

Compatible	IEEE488.2	Partial compatibility
Standard	SCPI, 1999	Partial compatibility

Command Structure

SCPI commands follow a tree-like structure, organized into nodes. Each level of the command tree is a node. Each keyword in a SCPI command represents each node in the command tree. Each keyword (node) of a SCPI command is separated by a colon (:).

For example, the diagram below shows an SCPI sub-structure and a command example.

Command types

There are a number of different instrument commands and queries. A command sends instructions or data to the unit and a query receives data or status information from the unit.

Command types

Simple	A single command with/without a parameter
Example	*IDN?

Query	A query is a simple or compound command followed by a question mark (?). A parameter (data) is returned.
Example	meas:curr?
Compound	<p>Two or more commands on the same command line. Compound commands are separated with either a semi-colon (;) or a semi-colon and a colon (;:).</p> <p>A semi-colon is used to join two related commands, with the caveat that the last command must begin at the last node of the first command.</p>
Example	<p>meas:volt?;curr?</p> <p>A semi-colon and colon are used to combine two commands from different nodes.</p>
Example	meas:volt?;;sour:volt?
 Note (Further explanation)	A semi-colon(;) is used to connect two commands. A colon(:) at the start of a command indicates that the command starts from the root node. The first command can ignore that first colon. Any commands after the first command (for compound commands) that do not begin with a colon, must begin at the last node of the first command.

Command Forms Commands and queries have two different forms, long and short. The command syntax is written with the short form of the command in capitals and the remainder (long form) in lower case.

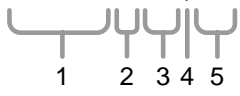

The commands can be written in capitals or lower-case, just so long as the short or long forms are complete. An incomplete command will not be recognized.

Below are examples of correctly written commands.

Long form	:SYSTem:ERRor?
	:SYSTEM:ERROR?
	:system:error?
Short form	SYST:ERR?
	syst:err?

Square Brackets Commands that contain square brackets indicate that the contents are optional. The function of the command is the same with or without the square bracketed items, as shown below.

For example the query “:OUTPut[:STATe]?” has two valid forms, “:OUTPut:STATe?” and “:OUTPut?”.

Command Format	HEADER	P1,P2	1.	Command header
			2.	Space
			3.	Parameter 1
			4.	Comma (no space before/after comma)
			5.	Parameter 2

Parameters	Type	Description	Example
	<Boolean>	Boolean logic	0, 1
	<NR1>	integers	0, 1, 2, 3
	<NR2>	decimal numbers	0.1, 3.14, 8.5
	<NR3>	floating point	4.5e-1, 8.25e+1
	<NRf>	any of NR1, 2, 3	1, 1.5, 4.5e-1
	<block data>	Definitive length arbitrary block data. A single decimal digit followed by data. The decimal digit specifies how many 8-bit data bytes follow.	
Message Terminator	LF	Line feed code

Status Register Overview

To program the ASR power supply effectively, the Status registers need to be understood. This chapter explains in detail how the Status registers are used and how to configure them.

Introduction to the Status Registers	167
The Status Registers	168
Questionable Status Register Group	169
Operation Status Register Group	172
Warning Status Register Group	174
System Lock Status Register Group	177
Standard Event Status Register Group	179
Status Byte Register & Service Request Enable Register	181

Introduction to the Status Registers

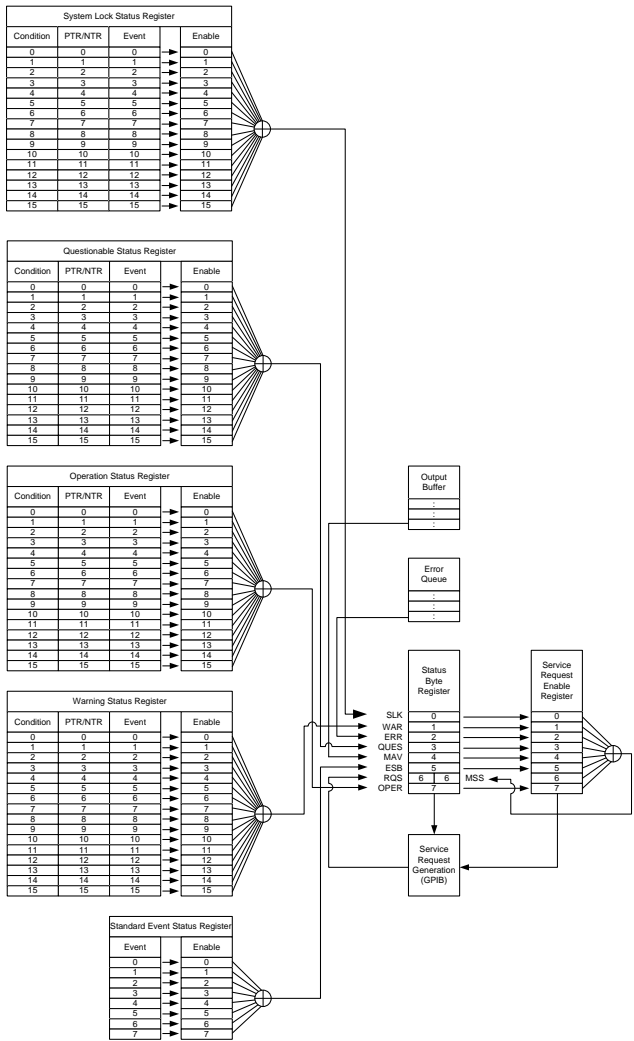

Overview

The status registers are used to determine the status of the power supply. The status registers maintain the status of the protection conditions, operation conditions and instrument errors. The ASR Series have a number of register groups:

- Questionable Status Register Group
- Standard Event Status Register Group
- Operation Status Register Group
- Warning Status Register Group
- System Lock Status Register Group
- Status Byte Register
- Service Request Enable Register
- Service Request Generation
- Error Queue
- Output Buffer

The diagram below shows the structure of the Status registers.

The Status Registers

Questionable Status Register Group

Overview

The Questionable Status Register Group indicates if any protection modes or limits have been tripped.

Bit Summary		Event	Bit #	Bit Weight
		Output Overvoltage	0	1
		Over internal maximum voltage (110% of rating voltage).		
		Over Irms Current	1	2
		Output current RMS value is excessive		
		DCAC Power Unit Error	3	8
		Internal DCAC power unit function error.		

DCDC Power Unit Error	4	16
Internal DCDC power unit function error.		
Output Short	5	32
Call attention to output terminal short status		
Over Ipeak+ Current or Over Ipeak- Current	6	64
Positive/Negative output current peak value is excessive.		
Fan Failure	7	128
Fan failure. Contact service center.		
Calibration Data Error	8	256
The calibration data is abnormal or out of allowance range.		
Output Over-Power	9	512
Over internal power stage maximum power (110% of rating power)		
IPK Limit	10	1024
The peak current limiter is activated.		
Remote Sensing Voltage Out of Range	11	2048
The Sensing voltage limiter is activated.		
IRMS Limit	12	4096
The RMS current limiter is activated.		
Always 0	15	32768

Condition Register	The Questionable Status Condition Register indicates the status of the power supply. If a bit is set in the Condition register, it indicates that the event is true. Reading the condition register does not change the state of the condition register.	
PTR/NTR Filters	The PTR/NTR (Positive/Negative transition) register determines the type of transition conditions that will set the corresponding bit in the Event Registers. Use the Positive transition filter to view events that change from false to positive, and use the negative transition filter to view events that change from positive to negative.	
	Positive Transition	0→1
	Negative Transition	1→0
Event Register	The PTR/NTR Register will dictate the type of transition conditions will set the corresponding bits in the Event Register. If the Event Register is read, it will be cleared to 0.	
Enable Register	The Enable register determines which Events in the Event Register will be used to set the QUES bit in the Status Byte Register.	

Operation Status Register Group

Overview

The Operation Status Register Group indicates the operating status of the power supply.

Bit Summary	Event	Bit #	Bit Weight
	Busy Status	1	2
	LOCK status (SYNC) status	8	256
	Hold Status(Sequence)	12	4096
	Run Status(Sequence)	14	16384
	Always 0	15	32768

Condition Register	The Operation Status Condition Register indicates the operating status of the power supply. If a bit is set in the Condition register, it indicates that the event is true. Reading the condition register does not change the state of the condition register.
--------------------	---

PTR/NTR Filters	The PTR/NTR (Positive/Negative transition) register determines the type of transition conditions that will set the corresponding bit in the Event Registers. Use the Positive transition filter to view events that change from false to positive, and use the negative transition filter to view events that change from positive to negative.
	Positive Transition 0→1
	Negative Transition 1→0

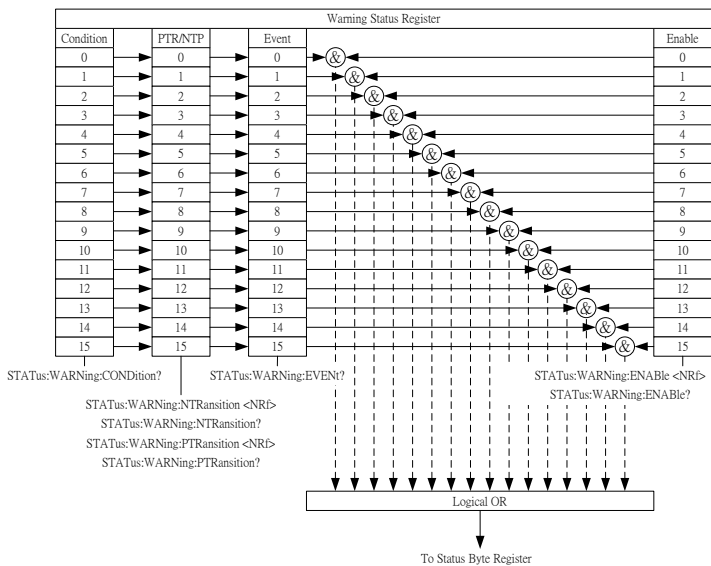

Event Register	The PTR/NTR Register will dictate the type of transition conditions will set the corresponding bits in the Event Register. If the Event Register is read, it will be cleared to 0.
----------------	--

Enable Register	The Enable register determines which registered Events in the Event Register will be used to set the OPER bit in the Status Byte Register.
-----------------	--

Command Errors

Overview

An <error/event number> in the range [-199 , -100] indicates that an IEEE 488.2 syntax error has been detected by the instrument's parser. The occurrence of any error in this class shall cause the command error bit (bit 5) in the event status register (IEEE 488.2, section 11.5.1) to be set. One of the following events has occurred:

- An IEEE 488.2 syntax error has been detected by the parser. That is, a controller-to-device message was received which is in violation of the IEEE 488.2 standard. Possible violations include a data element which violates the device listening formats or whose type is unacceptable to the device.
- An unrecognized header was received. Unrecognized headers include incorrect device-specific headers and incorrect or unimplemented IEEE 488.2 common commands.

Events that generate command errors shall not generate execution errors, device-specific errors, or query errors; see the other error definitions in this chapter.

Error Code	Description
-100 Command Error	This is the generic syntax error for devices that cannot detect more specific errors. This code indicates only that a Command Error as defined in IEEE 488.2,11.5.1.1.4 has occurred.
-102 Syntax error	An unrecognized command or data type was encountered; for example, a string was received when the device does not accept strings.
-103 Invalid separator	The parser was expecting a separator and encountered an illegal character; for example, the semicolon was omitted after a program message unit, MEAS:VOLT:DC?:MEASCURR:DC?
-104 Data type error	The parser recognized a data element different than one allowed; for example, numeric or string data was expected but block data was encountered.
-108 Parameter not allowed	More parameters were received than expected for the header; for example, the :SYSTem:KLOCK command only accepts one parameter, so receiving SYSTem:KLOCK 1,0 is not allowed.
-109 Missing parameter	Fewer parameters were received than required for the header; for example, the :SYSTem:KLOCK command requires one parameter, so receiving :SYSTem:KLOCK is not allowed.
-111 Header separator error	A character which is not a legal header separator was encountered while parsing the header; for example, no white space followed the header, thus *SRE2 is an error.

-112 Program mnemonic too long	The header contains more than twelve characters (see IEEE 488.2, 7.6.1.4.1).
-113 Undefined header	The header is syntactically correct, but it is undefined for this specific device; for example, *XYZ is not defined for any device.
-114 Header suffix out of range	The value of a numeric suffix attached to a program mnemonic, see Syntax and Style section 6.2.5.2, makes the header invalid.
-115 Unexpected number of parameters	The number of parameters received does not correspond to the number of parameters expected. This is typically due to an inconsistency with the number of instruments in the selected group.
-120 Numeric data error	This error, as well as errors -121 through -129, are generated when parsing a data element which appears to be numeric, including the nondecimal numeric types. This particular error message should be used if the device cannot detect a more specific error.
-121 Invalid character in number	An invalid character for the data type being parsed was encountered; for example, an alpha in a decimal numeric or a "9" in octal data.
-128 Numeric data not allowed	A legal numeric data element was received, but the device does not accept one in this position for the header.
-131 Invalid suffix	The suffix does not follow the syntax described in IEEE 488.2, 7.7.3.2, or the suffix is inappropriate for this device.

-141 Invalid character data	Either the character data element contains an invalid character or the particular element received is not valid for the header.
-148 Character data not allowed	A legal character data element was encountered where prohibited by the device.
-151 Invalid string data	A string data element was expected, but was invalid for some reason (see IEEE 488.2, 7.7.5.2); for example, an END message was received before the terminal quote character.
-158 String data not allowed	A string data element was encountered but was not allowed by the device at this point in parsing.
-160 Block data error	This error, as well as errors -161 through -169, are generated when parsing a block data element. This particular error message should be used if the device cannot detect a more specific error.
-161 Invalid block data	A block data element was expected, but was invalid for some reason (see IEEE 488.2, 7.7.6.2); for example, an END message was received before the length was satisfied.
-168 Block data not allowed	A legal block data element was encountered but was not allowed by the device at this point in parsing.
-178 Expression data not allowed	A legal expression data was encountered but was not allowed by the device at this point in parsing.

Execution Errors

Overview An <error/event number> in the range [-299 , -200] indicates that an error has been detected by the instrument’s execution control block. The occurrence of any error in this class shall cause the execution error bit (bit 4) in the event status register (IEEE 488.2, section 11.5.1) to be set. One of the following events has occurred:

- A <PROGRAM DATA> element following a header was evaluated by the device as outside of its legal input range or is otherwise inconsistent with the device’s capabilities.
- A valid program message could not be properly executed due to some device condition.

Execution errors shall be reported by the device after rounding and expression evaluation operations have taken place. Rounding a numeric data element, for example, shall not be reported as an execution error. Events that generate execution errors shall not generate Command Errors, device-specific errors, or Query Errors; see the other error definitions in this section.

Error Code	Description
-200 Execution error	This is the generic syntax error for devices that cannot detect more specific errors. This code indicates only that an Execution Error as defined in IEEE 488.2, 11.5.1.1.5 has occurred.

-201 Invalid while in local	Indicates that a command is not executable while the device is in local due to a hard local control (see IEEE 488.2, 5.6.1.5); for example, a device with a rotary switch receives a message which would change the switches state, but the device is in local so the message cannot be executed.
-203 Command protected	Indicates that a legal password-protected program command or query could not be executed because the command was disabled.
-211 Trigger ignored	Indicates that a GET, *TRG, or triggering signal was received and recognized by the device but was ignored because of device timing considerations; for example, the device was not ready to respond. Note: a DT0 device always ignores GET and treats *TRG as a Command Error.
-213 Init ignored	Indicates that a request for a measurement initiation was ignored as another measurement was already in progress.
-220 Parameter error	Indicates that a program data element related error occurred. This error message should be used when the device cannot detect the more specific errors described for errors -221 through -229.
-221 Settings conflict	Indicates that a legal program data element was parsed but could not be executed due to the current device state (see IEEE 488.2, 6.4.5.3 and 11.5.1.1.5.).

-222 Data out of range	Indicates that a legal program data element was parsed but could not be executed because the interpreted value was outside the legal range as defined by the device (see IEEE 488.2, 11.5.1.1.5.).
-224 Illegal parameter value	Used where exact value, from a list of possibles, was expected.

Device Specific Errors

Overview	<p>An <error/event number> in the range [-399 , -300] or [1 , 32767] indicates that the instrument has detected an error which is not a command error, a query error, or an execution error; some device operations did not properly complete, possibly due to an abnormal hardware or firmware condition. These codes are also used for self-test response errors. The occurrence of any error in this class should cause the device-specific error bit (bit 3) in the event status register (IEEE 488.2, section 11.5.1) to be set. The meaning of positive error codes is device-dependent and may be enumerated or bit mapped; the <error message>string for positive error codes is not defined by SCPI and available to the device designer.</p>
----------	--

Note that the string is not optional; if the designer does not wish to implement a string for a particular error, the null string should be sent (for example, 42,""). The occurrence of any error in this class should cause the device-specific error bit (bit 3) in the event status register (IEEE 488.2, section 11.5.1) to be set. Events that generate device-specific errors shall not generate command errors, execution errors,

or query errors; see the other error definitions in this section.

Error Code	Description
-310 System error	Indicates that some error, termed “system error” by the device, has occurred. This code is device-dependent.
-320 Storage fault	Indicates that the firmware detected a fault when using data storage. This error is not an indication of physical damage or failure of any mass storage element.

Query Errors

Overview An <error/event number> in the range [-499 , -400] indicates that the output queue control of the instrument has detected a problem with the message exchange protocol described in IEEE 488.2, chapter 6. The occurrence of any error in this class shall cause the query error bit (bit 2) in the event status register (IEEE 488.2, section 11.5.1) to be set. These errors correspond to message exchange protocol errors described in IEEE 488.2, section 6.5. One of the following is true:

- An attempt is being made to read data from the output queue when no output is either present or pending;
- Data in the output queue has been lost.

Events that generate query errors shall not generate command errors, execution errors, or device-specific errors; see the other error definitions in this section.

Error Code	Description
-400 Query error	This is the generic query error for devices that cannot detect more specific errors. This code indicates only that a Query Error as defined in IEEE 488.2, 11.5.1.1.7 and 6.3 has occurred.
